Introduction

Photomatix Essentials processes multiple exposure bracketed photos into a single image either by a process known as **fusing** the exposures together or through a process known as **HDR** (High Dynamic Range) **tone mapping**.

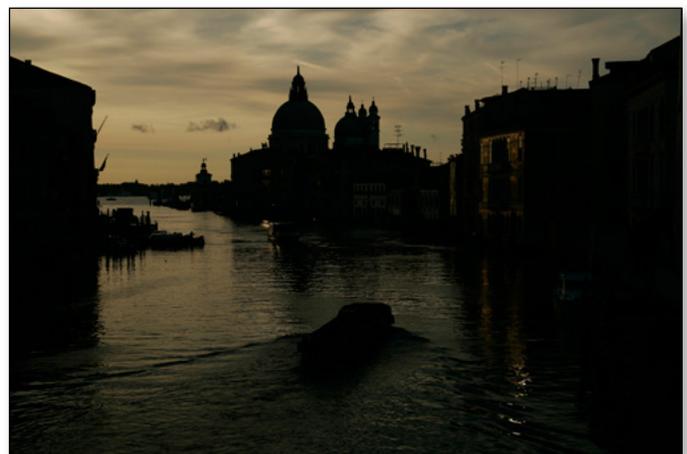

This manual is organized into three major sections. The first section is a general description of HDR photography and how to shoot it. The second section is a detailed tutorial on how to use Photomatix Essentials. The third section explains how to use the Image Alignment, Ghost Removal and Noise Reduction features offered by Photomatix Essentials. At the end of the manual is a glossary of some of the terms associated with HDR.

Section 1: HDR (High Dynamic Range) Photography

The central premise of HDR photography is that there are very few situations where a single photograph can capture the true dynamic range (the total range of light in a scene, from very dark to very light) of a scene accurately.

In other words, today's digital camera can't properly expose everything at the same time in scenes with even moderate contrast ratios. This results in two main problems (which sometimes happen together in the same photo):

- **Blown highlights:** When the exposure is raised to make sure the foreground or subject is properly exposed, brighter areas of the scene suffer. They "blow out" and turn white because they have very little or no usable data in them.
- **Lost detail in shadows:** Conversely, when bright areas of a scene are protected (by lowering exposure), there is not enough light to register details on the camera's sensor in dark areas of the scene. These turn to shadow and blackness.

HDR photography solves these problems by taking enough photos (traditionally 3) to contain the entire exposure range of the scene. With that data in hand, Photomatix Essentials can merge the different photos and process them to rescue details from shadows and keep highlights from blowing out.

Aside from that practical rationale, HDR photography offers photographers and photo editors a new and powerful tool with which to take and "develop" their photographs and present them in a unique and inspirational way.

1.1 Taking Photos for HDR

Taking photos for HDR is easy. All it takes is a different mindset than for traditional photography, which emphasizes taking and editing a single photo, independent from any others.

Instead of taking a single exposure of a scene, for HDR you take at least 3 exposures: one optimized for midrange tones (as normal), plus one optimized for highlights and one optimized for shadows. This strategy for capturing more of a scene's true dynamic range, with exposures above and below a standard exposure, is called "exposure bracketing".

The resulting "bracketed set" of photos contains, as a group, more complete and true exposure information than any single image capture can possibly contain. The purpose of HDR software like Photomatix Essentials is to artfully combine this bracketed set into a single image, to achieve more faithful realism, heightened realism, or artistic effect.

But these artistic choices come later. The first step is capturing good bracketed sets.

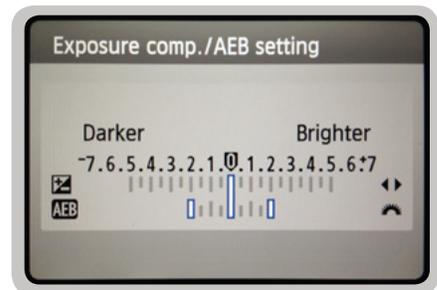

1.1.1 Setting Up Your Camera

HDR photography requires that you set up your camera a bit differently than normal:

- Set your camera to **Aperture priority** ("A" setting) so that only the shutter speed varies between the exposures.
- Select a low ISO, such as ISO 100 or lower.
- Turn off the flash. The flash may try to balance the exposure of all the images, when the goal is a range of exposures.
- Mount the camera on a tripod whenever possible. Even though Photomatix Essentials offers automatic alignment of hand-held photos, using a tripod is always better.

DSLR cameras and some compact digital cameras offer **Automatic Exposure Bracketing** (AEB). This enables you to automatically take three or more exposures in a row; one at the proper exposure, one or more underexposed, and one or more overexposed. Follow these steps if your camera offers an AEB mode:

- Select the **Continuous shooting** mode on the camera's drive setting. Consult your camera manual for model-specific instructions for using this setting.
- Set the camera to **Auto Exposure Bracketing** (AEB)
- If possible, use the camera's self-timer setting, a remote control or a cable release to minimize camera shake.
- Set the exposure increment to +/- 2 EV for optimal exposure range. If your camera does not offer +/- 2 EV exposure increments, select the maximum possible. Consult your camera's manual for model-specific instructions for choosing this setting.

Canon Rebel T2i/550D LCD showing AEB with +/- 2 EV increments selected

AEB settings on a Nikon D7000 (3 frames, at +/- 2 EV)

1.1.2 Taking the Bracketed Photos

In simplified terms, bracketing allows you to extend the dynamic range of your camera so it can capture the full range of light in a scene. Mechanically, you accomplish this by taking multiple photos with different exposure settings. Although there is no single method that is better than all others in every circumstance (indeed, cameras vary in their abilities, complicating matters), a good rule of thumb is to shoot three photos, separated by 2.0 EV using AEB. However, not all cameras have the same AEB capabilities. Some limit you to a 1 EV spacing or less.

You can shoot more or fewer photos separated by more or less EV. The final results may vary greatly, depending on your bracketing strategy.

Section 2: Using Photomatix Essentials

The Photomatix Essentials application workflow comprises two main steps:

Step 1. Load your bracketed photos into Photomatix Essentials.

Step 2. Adjust the combined image to your liking, then process and save it.

2.1 Loading and Managing Photos (Step 1)

To use Photomatix Essentials, first select the photo or photos you want to use and load them into the program. There are two ways to accomplish this:

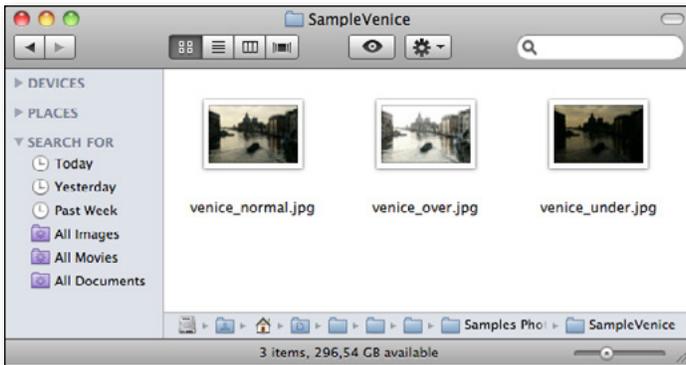

- **Drag and drop:** Drag the photos from a folder on your computer and drop them onto Photomatix Essentials.
- **Browse:** Use the Open dialog box to identify and load the source photos into Photomatix Essentials.

NOTE: It is possible to select a single photo if you like. Click on the “Can I use a single photo?” link for more details.

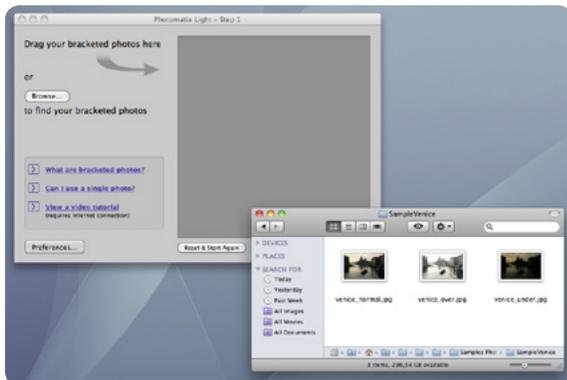

2.1.1 Dragging and Dropping

To drag one or more photos into Photomatix Essentials, follow these steps:

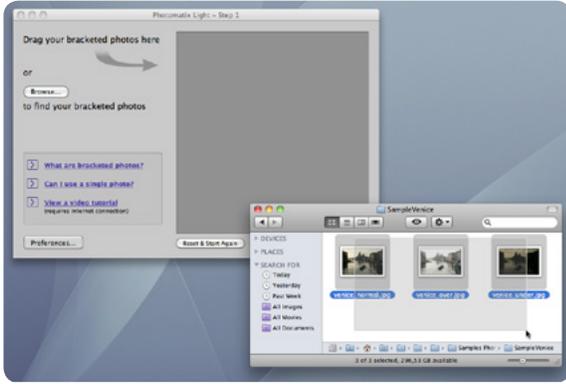

1. Launch Photomatix Essentials.
2. Open the folder on your computer that contains the photo or photos you want to work with.

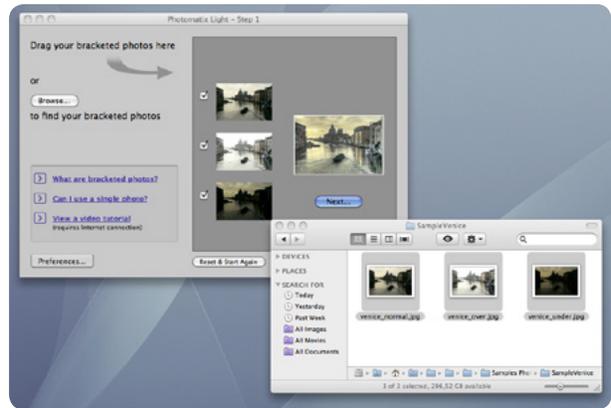

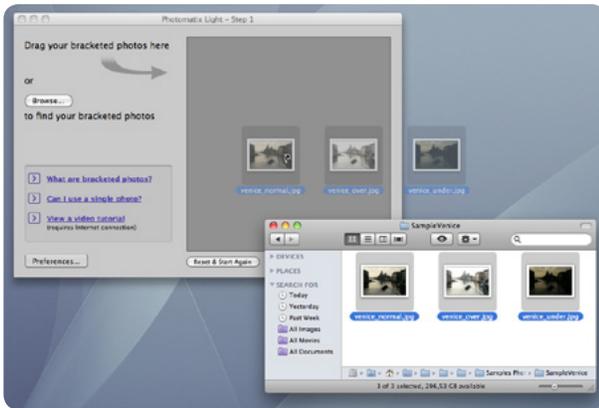

3. Arrange the folder and Photomatix Essentials so you can drag files from the folder and drop them onto Photomatix Essentials.

4. Select the files as you would normally.

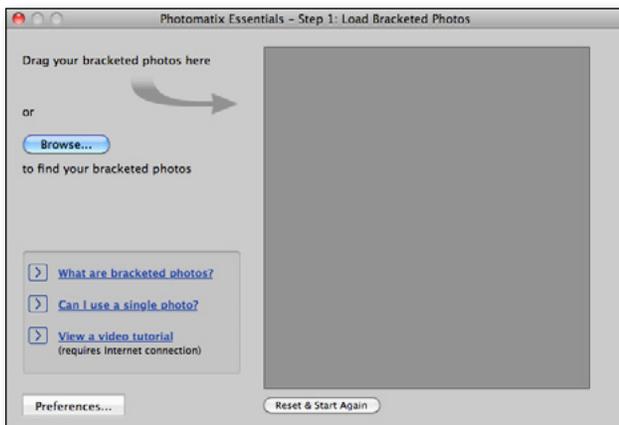

5. Drag and drop the photos to Photomatix Essentials. You can drag and drop file individually or in groups.

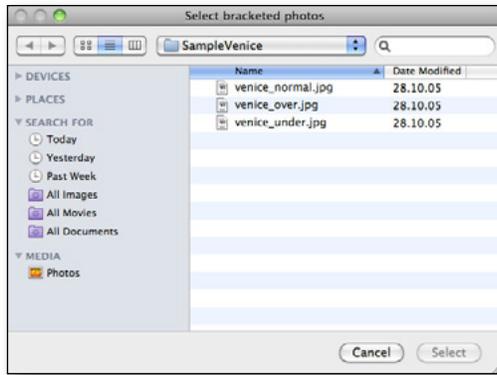

2.1.2 Browsing

To browse to one or more photos using a file selection dialog box, follow these steps:

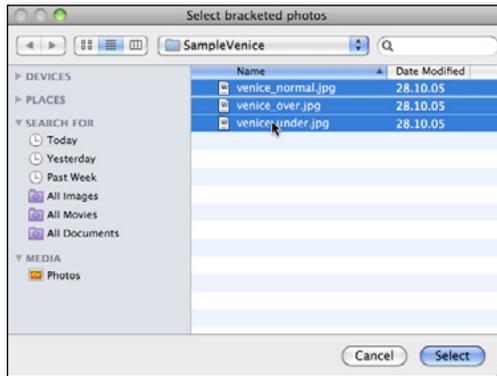

1. Launch Photomatix Essentials.
2. Click **Browse**.

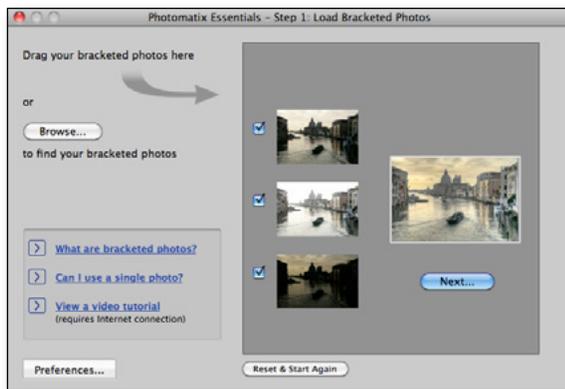

3. Navigate to the folder on your system where the photo(s) are stored.

4. Select the files as you would normally.

5. Choose **Open** (Windows) or **Select** (Macintosh).

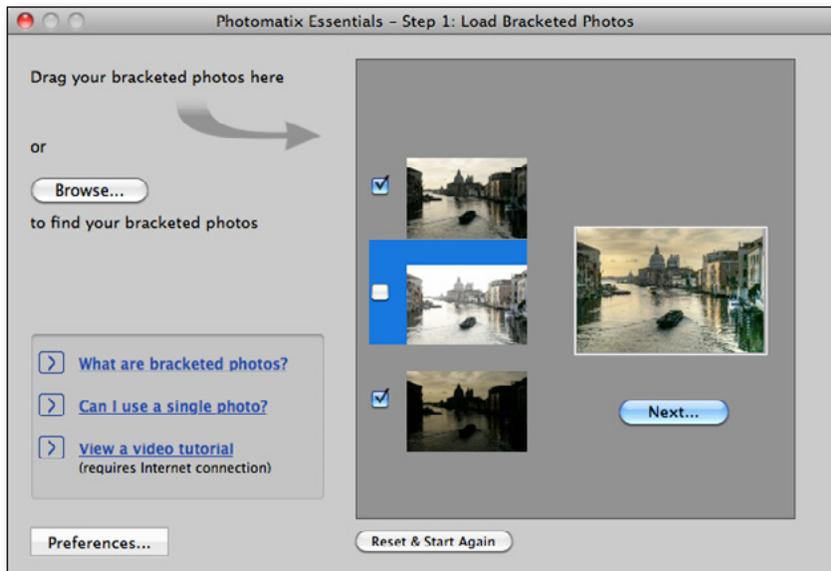

Regardless of the method you choose, you can go back and add photos. Drag and drop additional photos or choose Browse again to choose more files.

You may mix and match these two methods.

2.1.3 Managing Photos

Once you load your photos into Photomatix Essentials, you should notice a few things in the interface. First, each photo is displayed as a thumbnail. This makes it easy to verify that the photos are of the same subject and see their relative exposure compared to their bracketed companions. Additionally, there is a larger combined thumbnail that shows a preview of the result of processing the photos using default settings.

Finally, there is a checkbox beside each photo's thumbnail (this is checked by default unless you loaded only one photo). A checked box signifies that the photo will be included in subsequent processing. Uncheck a photo to take it out of the process. You'll see the larger thumbnail update to show the processing preview using just the currently checked photos. Re-check the photo to put it back into the mix.

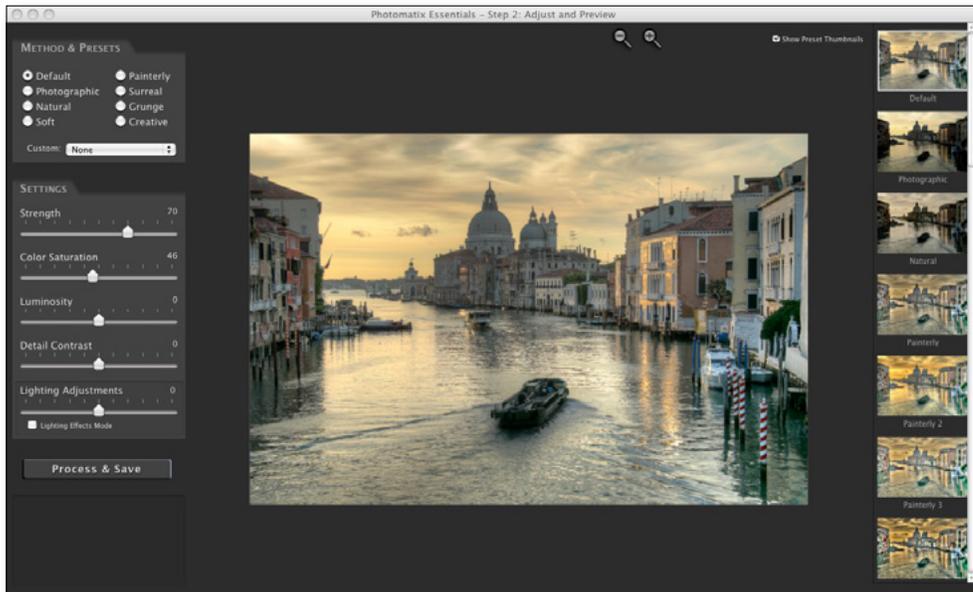

2.1.4 Starting Over or Continuing

To start over, select **Reset & Start Again**. You'll jump back to a clean interface and be ready to select new bracketed photos.

To continue to Step 2 with the currently loaded and checked photos, select **Next**.

2.2 Adjusting the Image with Fusion or Tone Mapping (Step 2)

The heart of Photomatix Essentials is Step 2, where you choose settings to process your bracketed photos.

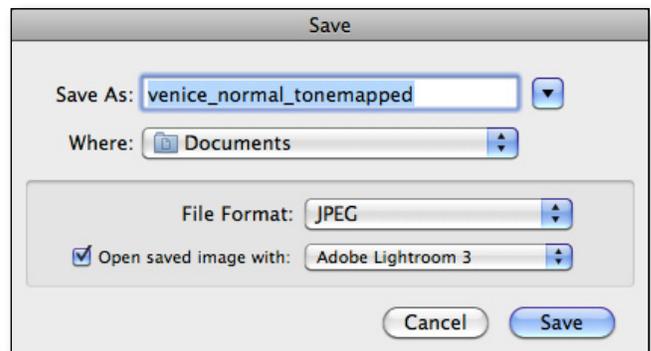

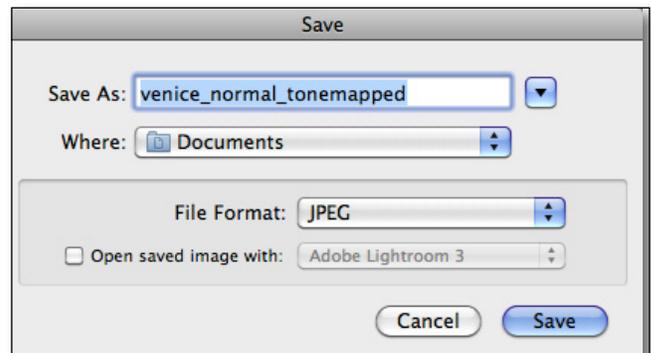

2.2.1 Step 2 Overview

Follow these steps when you enter Step 2:

1. Click on the thumbnails on the right side to select a preset that gives you the result you prefer. (Refer to section 2.2.2 on the next page for details on working with presets)
2. If necessary, adjust the settings on the left to refine the effect.
3. When you are satisfied with the result, select **Process & Save**.
4. Enter a new file name, if desired, and select a file type:
 - **TIFF 16-bit:** This is the highest quality output available and is the best format if you plan on processing the image further in an image editor.
 - **JPEG:** JPEG is best if you want to go straight to the Web or other medium with no further processing.
5. If you want to automatically open the processed image in an image editor, select **Open saved image with**, then choose an image editor.
6. Choose **Save**.

Once you have clicked on the **Save** button, Photomatix Essentials processes your photos at original resolution, aligning them and either tone mapping or fusing them. It also applies noise reduction and ghost removal if you have chosen to enable these options in Preferences.

2.2.2 Working With Presets

Photomatix Essentials lists presets in the form of thumbnails on the right side of the Step 2 window. Each thumbnail is a small preview of the effect of that preset on your image. When you click a thumbnail, that preset is selected and applied to the main preview. The parameters at the left of the screen are also updated to reflect the settings contained in that preset.

These built-in thumbnail presets are “factory” presets that are provided with the software. Photomatix Essentials offers 27 built-in presets when you are working with bracketed photo sets, 23 presets when you have loaded just a single photo.

The built-in presets use a range of different settings combinations that provide pleasing results with a wide variety of image types. Built-in presets are a good starting point for exploring your own custom settings, fine-tuned to your specific image.

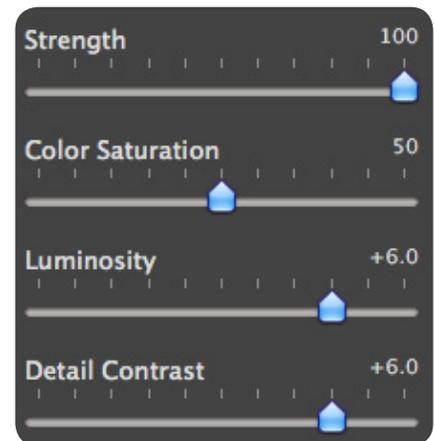

Different combinations of settings produce a wide range of image effects and styles. When you find a new settings combination that works well for a given type of image, you may wish to save this settings combination for future use with similar images. To save your own “**custom preset**” for convenient access later, in the Presets drop-down list:

1. Click the Presets drop-down list.
2. Select **Save Preset** from the list.
3. Enter a name for the preset in the File name field and click **Save**.

If you save the preset in the default location (which is also the Presets folder used by the Photomatix Pro application), the preset is automatically added to the Presets combo-box list. If you save it in another location, you can access it by clicking on the Presets drop-down list and selecting **Load Preset** from the list.

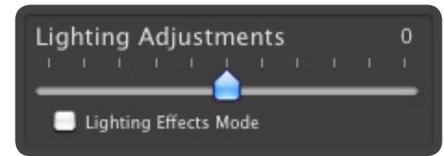

2.2.3 Details Enhancer Settings

- **Strength:** Affects the degree to which contrast and detail are enhanced in the image. A value of 100 gives the maximum amount of enhancement. To get a more natural effect, move the slider to the left. The default value is 70.
- **Color Saturation:** Controls the saturation of the RGB color channels. The greater the saturation, the more intense the color. Move the slider right or left to change the setting. A value of 0 produces a grayscale image. The value affects each color channel equally. The default value is 46.
- **Luminosity:** Controls the compression of the tonal range, which has the effect of adjusting the global luminosity level. Move the slider to the right to boost shadow details and brighten the image. Move it to the left to give a more “natural” look to the resulting image. The default value is 0.
- **Detail Contrast:** Controls the amount of contrast applied to detail in the image. Move the slider to the right to increase the contrast of the details and give a sharper look to the image. Note that increasing the contrast also has a darkening effect. Move the slider to the left to decrease the contrast of details and brighten the image.

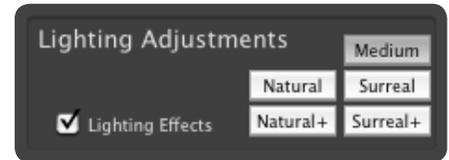

Details Enhancer – General Settings

- **Lighting Adjustments:** Affects the overall 'look', controlling the extent to which the image looks natural or surreal. When the Lighting Effects Mode box is unchecked, move the slider to the right to make the image look more natural and to the left to make it look more 'painterly' or 'surreal'.
- **Lighting Effects Mode:** The checkbox lets you switch between two modes for the Lighting Adjustments setting, where each mode produces slightly different results. Checking the box tends to produce results with a type of 'Magic Light' effect. Note that finer control is not possible in Lighting Effects mode.

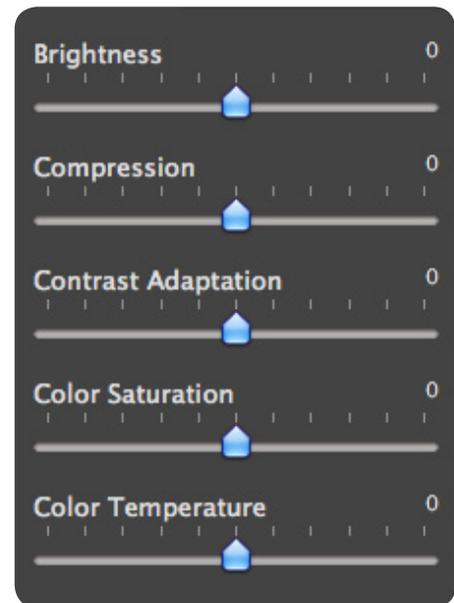

*Details Enhancer –
Lighting Adjustment Settings*

*Details Enhancer –
Lighting Effects Mode*

2.2.4 Tone Compressor Settings

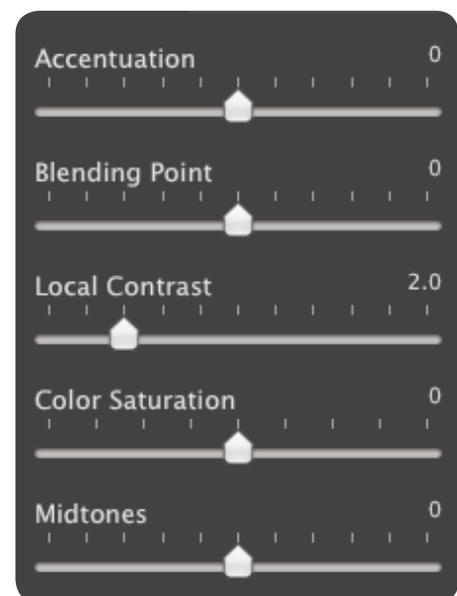

- **Brightness:** Adjusts the overall brightness of the tone mapped image. The default value is 0.
- **Compression:** Controls the compression of the tonal range. Move the slider to the right to shift both shadows and highlights toward the mid-tones in the tone mapped image. The default value is 0.
- **Contrast Adaptation:** Adjusts the influence of the average brightness in relation to the intensity of the processed pixel. Move the slider to the right to create more pronounced colors. Move the slider to the left to create a more "natural" look. The default value is 0.
- **Color Saturation:** Adjusts the color saturation of the tone mapped image. The greater the saturation, the more intense the color. The value affects each color channel equally. The default value is 0.
- **Color Temperature:** Adjusts the color temperature of the tone mapped image relative to the temperature of the HDR source image. Move the slider to the right for a warmer, more yellow-orange colored look. Move it to the left for a colder, more bluish look. A value of 0 (default) preserves the original color temperature of the HDR source image.

Tone Compressor Settings

2.2.5 Exposure Fusion Settings

- **Accentuation:** Adjusts the strength of the overall effect.
- **Blending Point:** Adjusts how much weight to give the underexposed or overexposed images. When you move the slider to the right, the overexposed images are favored, which tends to brighten the resulting image. The reverse happens when you move the slider to the left.
- **Local Contrast:** Increases the contrast and sharpness of details in the image. Increasing local contrast may have the side effect of making noise more visible, and of creating thin halo effects around strong luminosity edges. Values near the maximum tend to give a surreal look to the image. The default value is 2.
- **Color Saturation:** Adjusts the saturation of the color channels. The greater the saturation, the more intense the colors. A value of -10 produces a grayscale image.
- **Midtones:** Increases or decreases contrast in the midtones of the image. Raising it brightens the image but reduces the overall contrast. Lowering it darkens the image while increasing contrast.

Exposure Fusion Settings

Section 3: Preferences

Photomatix Essentials offers *Image Alignment*, *Ghost Removal* and *Noise Reduction*. You can choose whether to use these features and adjust some of their options in **Preferences**. To access **Preferences**, click on the **Preferences...** button located at bottom left of the window where you load your images in Step 1 of the Photomatix Essentials workflow.

3.1 Alignment Options

Image alignment is an important feature of HDR processing because bracketed photos are always mis-aligned when taken with a hand-held camera, and may even be slightly mis-aligned when taken with the aid of a tripod. Image alignment is turned on by default, but you can turn it off by selecting **No** in the **Align images** option.

You can also choose to be prompted whether to align your photos each time by selecting **Ask me whether to align**. Image alignment is recommended whenever you are processing bracketed photographs, but there are a few cases when it should not be selected. One example of such case is when you have derived different exposures from a single RAW file by adjusting the Exposure setting of your RAW converter. Another example is when you are processing stitched panoramas.

There are two methods offered for aligning images:

- The **By correcting horizontal and vertical shifts** method is fast, but only corrects for translation movements. This method is recommended when your bracketed photos were taken on a tripod.
- The **By matching features** corrects for rotation, translation and scaling differences, as well as perspective distortion.

The **Crop aligned images** option removes the unused borders that appear when the images are shifted to correct for mis-registration. Leave this box unchecked if you need the resulting image to have the same width and height as the source images.

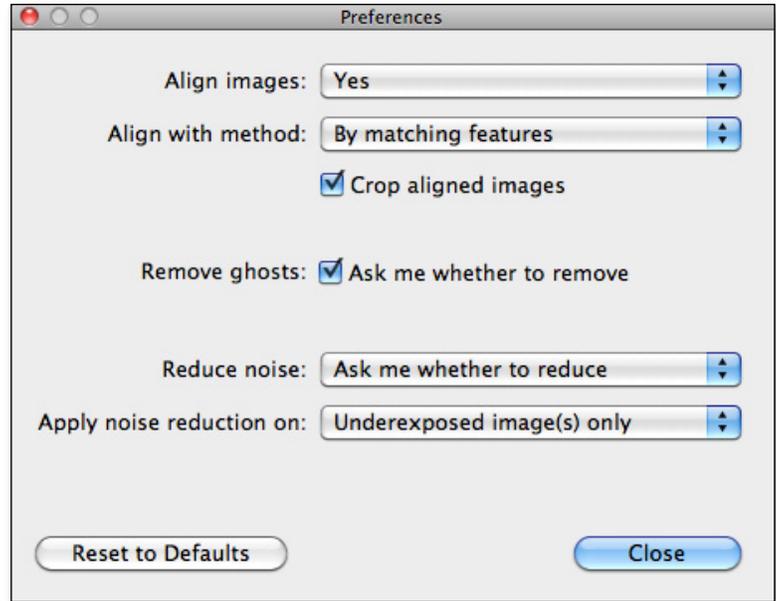

3.2 Ghost Removal Option

The **Remove ghosts** option addresses the problem of artifacts that appear when combining images of a dynamic scene. For example, if people are walking through the scene while you capture your bracketed photos, multiple faint images of the people will appear multiple times in the combined image as if there were “ghosts”. This is why artifacts arising from movements in the scene are commonly referred to as “ghosting” and the attempt to eliminate them is referred to as “deghosting”.

After you have loaded bracketed photos and have then clicked **Next...**, Photomatix Essentials shows by default a prompt asking whether you would like to remove ghosts. If you prefer not to show the prompt, uncheck the **Ask me whether to remove** box.

3.3 Noise Reduction Options

Noise Reduction is often useful when using presets such as Painterly, Surreal or Grunge, because these presets enhance local details, which has the drawback of accentuating noise. Noise reduction is particularly

recommended when processing RAW files directly in Photomatix, or when processing just one photo, especially when this photo is underexposed.

You can turn **Noise Reduction** on or off, or be prompted whether to apply it after Step 2, by adjusting the **Reduce noise** option. Since reducing noise takes time, you can choose to process only a subset of your source images with noise reduction by adjusting the **Apply noise reduction on** option.

Glossary

AEB mode	(Automatic Exposure Bracketing). DSLR cameras and some compact digital cameras offer this feature. It enables you to automatically take three or more exposures in a row: one at the proper exposure, one or more underexposed, and one or more overexposed.
Aperture priority	In Aperture Priority mode, you select the aperture and the camera determines the correct shutter speed for the available light. The shutter speed also depends on ISO sensitivity. This is the right mode for shooting bracketed shots for HDR (refer to Section 1 for more information).
Bit	Bits represent digital data in computers. Digital Images are made of bits. A bit depth corresponds to $2^{(\text{Bit Depth})}$ levels (e.g. 256 levels for 8-bit).
Bit depth	The number of bits a file type uses to represent a pixel's color at a given location in an image.
Bracketed images	A group of photos taken with the Automatic Exposure Bracketing function of a camera, resulting in photos of the same scene taken with different exposures.
dSLR	Digital Single Lens Reflex camera.
Dynamic range	In the context of HDR photography, the total range of light intensity in a scene, from the deepest shadows to the brightest highlights.
Exposure	The amount of light that enters a camera for the length of time the shutter is open. Exposure depends on aperture and shutter speed, as well as the camera's sensitivity to light (controlled by the ISO). "Exposure" is also shorthand for a photograph or frame (a frame of film).
Exposure fusion	Combination of photos of the same scene taken under different exposure settings in such a way that highlight details are taken from the underexposed photos and shadow details from the overexposed ones.
EV (Exposure Value)	A measure of exposure which is the equivalent of a stop. In the absolute sense, EV is defined as the exposure from a photo taken at 1 second, f/1, and ISO 100. In the relative sense, the correct exposure is normally 0 EV and any deviation is measured in positive or negative EV from that mark.
HDR	High Dynamic Range.
HDR image	Strictly speaking, an HDR image is an intermediary image with 32 bits per color channel (96 bits per pixel). An HDR image is the result of merging photos of the same scene taken under different exposure settings and stored in special HDR image format. The 32-bit intermediary HDR image must be processed with tone mapping for proper display on standard monitors and prints. It has become very common to define "HDR image" as the result of processing the 32-bit HDR image with tone mapping, i.e. the tone mapped output, but this is not technically correct.

JPEG	A common image file format with two primary strengths – a relatively small file size and universal compatibility. JPEGs use a lossy compression scheme and should not be edited and re-saved.
Noise	Statistical variations inherent in the sensor system cause noise. Noise is always present, but higher sensitivities and smaller sensors usually generate more noise.
Pixel	Digital pictures consist of pixels, the smallest units. Each pixel has a color that can be represented by 8 or 16 bits or as a floating-point number (32-bit HDR).
PPI	Pixels per Inch. Can be used to describe the actual pixels per inch of a print. Often confused with DPI (Dots per Inch), used by color printers to print an image.
RAW file	A file containing the raw data from the camera sensor. RAW files do not have a color profile or other stylistic preferences permanently applied.
TIFF	A comprehensive image format that offers lossless compression schemes for smaller file sizes with higher quality. This format is suitable for editing and printing but not publishing on the Web.
Tone mapping	Processing a 32-bit HDR image into an image that can be properly viewed on monitors and in prints.

Resources

You can find more tips, techniques, and regularly updated information in the Photomatix FAQ on the HDRsoft website at http://www.hdrsoft.com/support/faq_photomatix.html. Additionally, the resources page at <http://www.hdrsoft.com/resources/> lists Internet tutorials, book and DVDs on the subject of HDR photography that, along with your own experience, will help deepen your understanding of it.
